## Mercy LIFE: Using Technology to Increase Operational Efficiency

### The Partner

Mercy LIFE (Living Independently for Elders), a member of Trinity Health of New England, is located in West Springfield, Massachusetts. LIFE is a Medicare and Medicaid program known in many states as PACE (Program of All-inclusive Care for the Elderly). Mercy LIFE serves more than 300 participants in Hampshire and Hamden counties.

### The Challenge

Mercy LIFE participants were utilizing a non-CareKinesis vendor electronic in-home medication dispensing system. This system was not meeting the patients' nor the center staff's needs. According to the staff, the device would often malfunction, required frequent medication refills, used antiquated telephone modems, mishandled non-adherence, and the manufacturer provided limited customer support. These shortcomings prevented Mercy LIFE from achieving its participant care goals, including improving medication adherence, limiting access to controlled substances, and decreasing caregiver burden. Mercy LIFE decided to pursue a new electronic medication dispensing system with CareKinesis as a result.

### The Solution

*The MedaCube helps participants take their medication and reduces their risk of hospitalizations.*

**Kaitlin Swistak, RN**  
Mercy Mass, Clinic Manager

It was a natural choice for Mercy LIFE to select the MedaCube since the staff was familiar with the device through its partnership with CareKinesis. MedaCube is an in-home automated dispensing system that helps PACE participants to continue living independently and avoid nursing home or assisted living admission. The device provides caregivers and nurses

with real-time notifications when patients have not taken medications as expected. It does not require pre-sorting of medications or complicated canister configurations, so nursing time and the risk of error are reduced. If a patient misses a dose, or the sensors indicate tampering, the caregiver and center nurses are alerted.
